

In the article it goes over Metaverse technology and how it merges the digital and physical world into a space that has endless possibilities to thrive and improve. This has caused millions upon billions of people to connect and interact with each other in a large network web. The technology that allows the metaverse to be what it is are augmented reality and virtual technology which has technology that enhance the real world with computer-generated information and simulates a virtual experience by having 3D near-eye displays to make you feel like you're in a virtual environment.

In my opinion, metaverse technology has many advantages in the real world and virtual world. For example, It can be used by the military to help drone surveillance, virtual meetups, and virtual gaming. And as time goes on and the technology of space increases so will its user base which would allow it to become close to one of the most popular technologies. With the upgrading of metaverse technology increasing I grow ever so more excited because of how someday we may get to a point in metaverse technology to where it looks almost exactly to what it looks like in the movies.
